

Configuring Circuit Breakers

Key Configuration Parameters

Sample Size

- Number of requests in the rolling window
- e.g. 100 requests per 10 seconds

Error Rate Threshold

- Proportion of failures to trip the breaker
- e.g. $15/100 = 0.15$ (15% failure rate)

Cooldown Period

- Time (in seconds) the breaker stays open
- During this time, requests are blocked

Optional: Half-Open State

- Can be enabled/disabled based on system needs
- Allows early recovery probing of upstream

Special Case: Service Discovery

- When circuit trips, Tyk refreshes the Gateway list via Service Discovery module
