

Multiple Upstreams & Gateways

Multiple Upstreams & Gateways

Multiple Upstream Hosts

- Circuit breaker applies at the API endpoint level, not per host.
- Sample + failure counts are aggregated across all upstreams.
- Breaker trips if threshold is breached, even if only some hosts are failing.
- In half-open mode, breaker resets if a healthy host responds.

Multiple Tyk Gateways

- Circuit breakers run independently on each Gateway node.
- No shared state between Gateways (no centralized tracking).
- Ensures high availability and low latency.
- In load-balanced setups:
 - One Gateway might trip early.
 - Others may continue sending traffic until they trip too.
