

GraphQL Proxy Only

Definition:

GraphQL Proxy Only is a type of GraphQL API in Tyk that:

- Uses a **single data source**
- Has a **read-only schema**
- Automatically **loads schema** from the upstream using introspection queries

Key Characteristics:

- Upstream must support **introspection**
- Useful for exposing existing GraphQL services securely
- Supports all Tyk features like **policies** and **rate limiting**
- Minimal configuration — no schema stitching or data merging

Creating a GraphQL Proxy Only API

Steps to Create:

1. Log in to the Tyk Dashboard
2. Go to **APIs** → **Add New API** → **GraphQL**
3. Provide a **name** and the **upstream URL**

If the upstream is protected:

- Select **Upstream Protected**
- Add **Authorization header** or **Certificate**
- Optionally tick **Persist headers for future use** to avoid re-entering them

Final Steps:

- Click **Configure API**
- Make any additional configuration changes
- Click **Save**

Your GraphQL Proxy Only API is now set up and ready to use.
