

gRPC Proxy

Using Tyk as a gRPC Proxy

- Tyk supports gRPC passthrough when using HTTP/2
- Routes gRPC requests based on:
 - `/ServiceName/MethodName`
- Tyk Features You Can Still Use
 - URL rewrites
 - ACLs via keys & policies
 - Load balancing
 - Service discovery
 - Authentication (JWT, OIDC, etc.)
 - Rate limiting
 - Logging & tracing (OpenTelemetry)
 - Mutual TLS

Anatomy of a gRPC Call in Tyk

- gRPC Call Format:
 - `/google.pubsub.v2.PublisherService/CreateTopic`
- Always uses `HTTP POST`
- Metadata → `HTTP headers`
- Policies and rewrites apply at method-level granularity

Prerequisites for gRPC Proxying

- Enable HTTP/2 in tyk.conf

```
"http_server_options": {  
  "enable_http2": true  
},  
"proxy_enable_http2": true
```
- Match listen path to service name
- Set `strip_listen_path`: false
