

Example of gRPC proxy using H2C

gRPC Proxy Example Using H2C

- Use case: Local setup for development or internal testing
- Tools required:
 - gRPC Server (e.g., [HelloWorld example from GitHub](#))
 - gRPC Client (e.g., grpcurl)
 - Tyk Gateway & Dashboard

gRPC client → Tyk Gateway → gRPC server (H2C connection)

Tyk gRPC H2C Proxy Setup Steps

1. Start your HelloWorld gRPC server (e.g., at `localhost:50051`)
2. In Tyk Dashboard, create a new API:
 - a. Set Protocol to `HTTP`
 - b. Uncheck Strip listen path
 - c. Set Listen Path to `/helloworld.Greeter`
 - d. Set Target URL to `h2c://localhost:50051`
3. Save and wait for the Gateway to reload
4. Note: `h2c://` prefix is key for enabling non-TLS HTTP/2 routing

Testing the Proxy

- Command Example:

```
grpcurl -plaintext \  
  -proto helloworld.proto \  
  -d '{"name": "joe"}' \  
  tyk-gateway:8080 \  
  helloworld.Greeter/SayHello
```

- Expected Response:

```
{"message": "Hello joe"}
```
