

MDCB Analytics

Handling analytics data

Gateways record analytics in Redis when they are processing API traffic

Pump processes analytics data, and moves it to the target data stores:

- MongoDB/PostgreSQL is the default data store for the Dashboard

Single data centre deployments use this approach:

- Additional data stores can be targeted

Control Plane Pump

04

Edge Pump

05Edge Pump w/
Hybrid Forward

MDCB Direct

- Original approach for handling MDCB analytics
- Does not use Pump component
- Gateway sends analytics data directly to MDCB, which processes and sends to Analytics Storage (MongoDB)
- Simple, but lacks support for range of target data stores

Pump****04**

Edge Pump

05Edge Pump w/
Hybrid Forward

CP Pump

- Reinstates the Pump into analytics workflow, improving storage options
- MDCB writes data to Redis
Pump processes analytics data
- Sends all analytics across internet
- Set `forward_analytics_to_pump` to `true` in MDCB configuration file

01MDCB
Analytics**02**

MDCB Direct

03Control Plane
Pump**04****Edge Pump****05**Edge Pump w/
Hybrid Forward

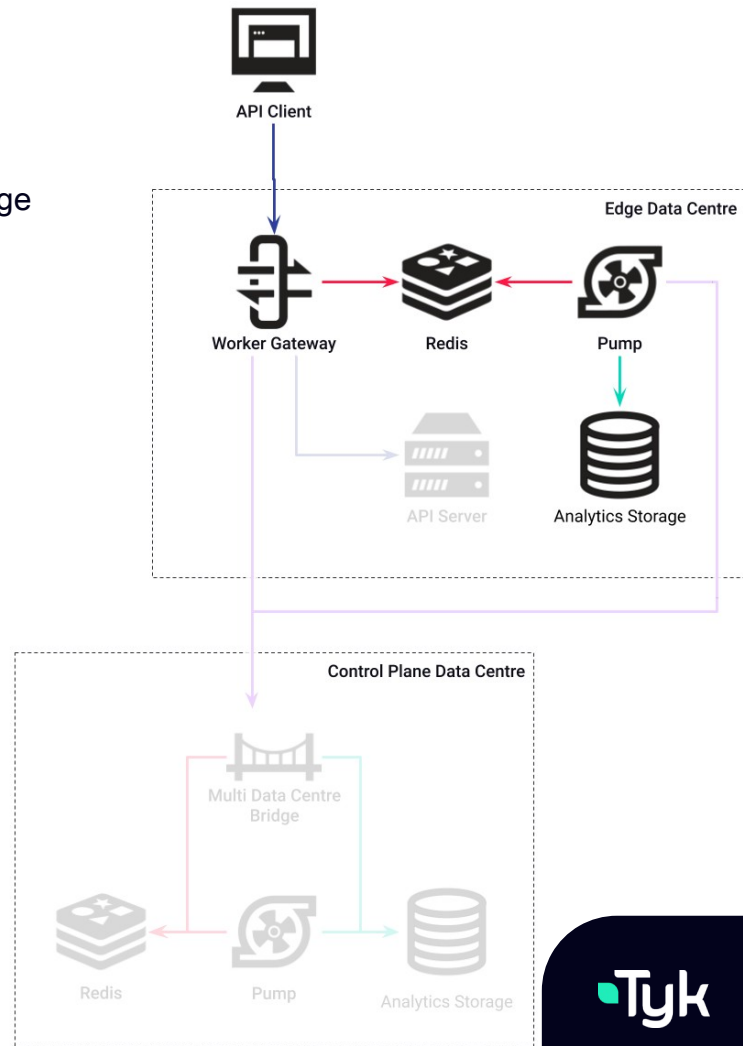

Edge Pump

- Localises analytics processing in Edge data centres:

- Avoids transferring data to Control Plane data centre
- Reporting not possible from Dashboard

- Operates in same way to single data centre deployment:

- Set `analytics_config.type` to empty string

Edge Pump

05**Edge Pump w/
Hybrid
Forward**

Edge Pump Hybrid Forward

- Edge Pump includes config for a hybrid type pump
- Hybrid pump can be configured to send only aggregated analytics:
 - Set meta.aggregated to true in hybrid pump configuration

Allows non-aggregated analytics to be processed locally with aggregate analytics sent to Control Plane for Dashboard reports
