

Server-Sent Events (SSE)

Overview

- SSE: Server pushes updates to client via HTTP
- One-way only (server → client)
- Use cases:
 - Stock tickers
 - Notifications
 - Activity feeds
- Simpler alternative to WebSockets when no client-to-server messaging is needed

Gateway Configuration for SSE

- Enable WebSocket/SSE support:
`"http_server_options.enable_websockets": true`
- Adjust timeouts to keep connection alive:
`"read_timeout"` and `"write_timeout"` (e.g. 2000)
- Stream flush control:
`"flush_interval": 1` (in seconds)

Example Setup – Streaming Messages

- Run Golang SSE server on :8000
- API configuration in Tyk:
 - `listen_path: /sse`
 - `strip_listen_path: true`
 - `target_url: http://host.docker.internal:8000`
- Test via:
`curl http://localhost:8080/sse/events/`

Output Example

- Console Output:

Message: 20 - the time is 2013-03-08 21:08:01.260967

Message: 21 - the time is 2013-03-08 21:08:06.262034

Message: 22 - the time is 2013-03-08 21:08:11.262608
