

API Security with Tyk: What is Rate Limiting

Understanding how Rate Limiting works

What is Rate Limiting?

- Rate limiting controls how many requests a user/system can make in a given timeframe.
- Prevent API abuse and maintain performance
- Client can make x number of requests per y number of seconds

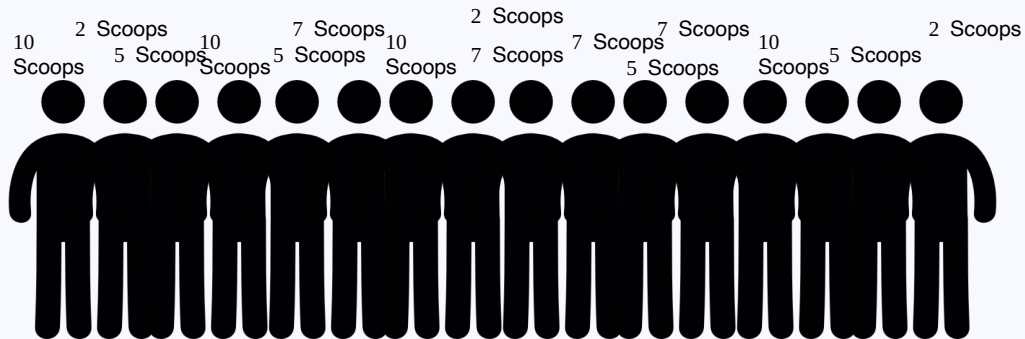

2 Scoops per minute

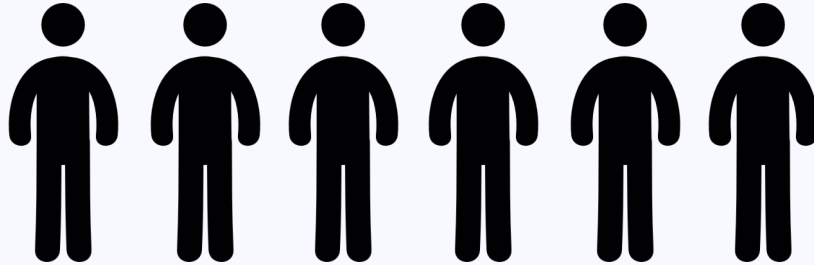

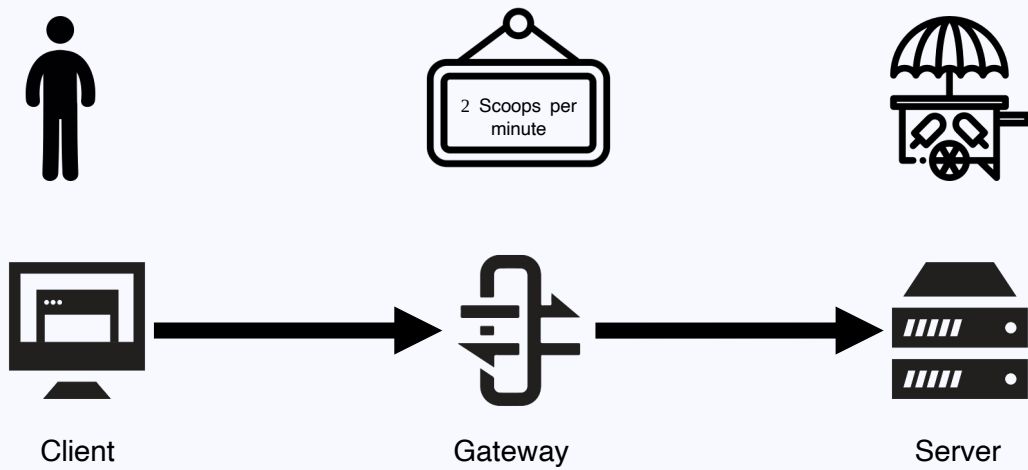

2 Scoops per minute

2 Scoops per minute

Why it's important?

Help mitigate API abuse and maintain performance

Rate limiting may be used as an **extra line of defense** around attempted denial of service attacks.

For instance, if you have load-tested your current system and established a performance threshold that you would not want to exceed to ensure system availability and/or performance then you may want to set a global rate limit as a defense to ensure it hasn't exceeded.
